AIWIZE LABS / SOFTWARE ENGINEER TRAINEES

Learn with AI.
Prove without AI.

7-day SQL + UI/UX preparation plan

1-hour fresher orientation • Hands-on learning • Offline assessment

SQL 65% | UI/UX 35%

What success looks like

Think clearly

Read a lending requirement, identify entities and relationships, choose an approach, and explain why.

Build correctly

Write and execute SQL; create and modify HTML, CSS and JavaScript; handle errors.

Explain independently

Defend every JOIN, filter, CSS change and event handler without AI assistance.

We value problem-solving and understanding — not copied solutions.

Your learning cycle: ChatGPT as a tutor, not a crutch

01

GENERATE

Build a realistic example

→

02

UNDERSTAND

Ask for line-by-line explanations

→

03

REPRODUCE

Close ChatGPT; write it yourself

→

04

CHANGE

Handle a new requirement

→

05

VERIFY

Run, debug and explain

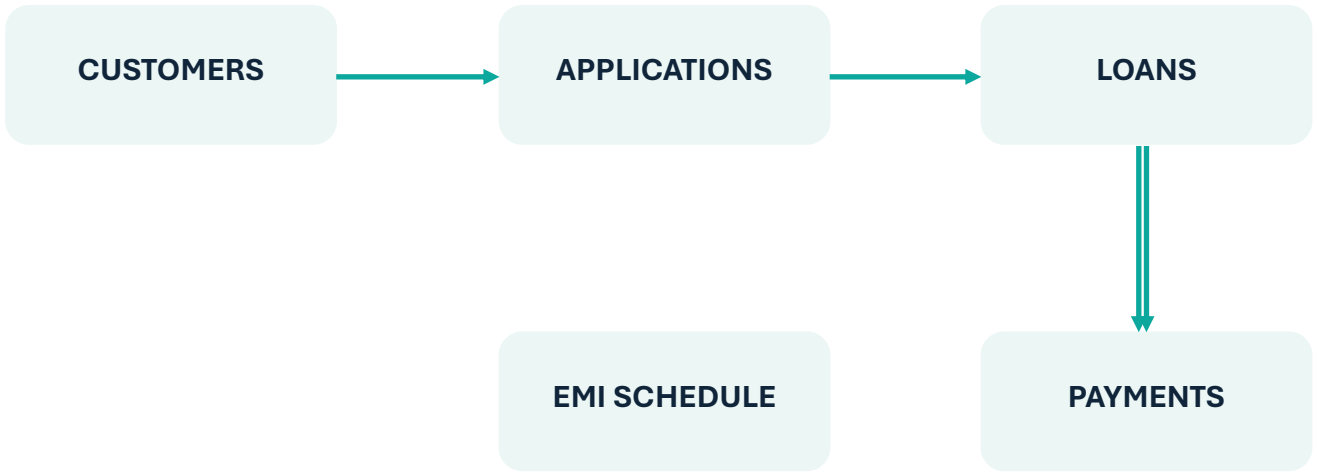

Rule: learn with unlimited AI support; demonstrate skill without AI.

Seven days: from guided learning to independent delivery

DAY 1	**Set up**	Create financial DB + basic loan form
DAY 2	**Understand**	15 SQL queries; HTML/CSS/JS anatomy
DAY 3	**Complexity**	15 advanced queries; 10 UI changes
DAY 4	**Depth**	10 very complex queries; dashboard changes
DAY 5	**Debug**	15 broken SQL queries; 10 UI defects
DAY 6	**Solo practice**	10 unseen SQL tasks; 5 independent UI changes
DAY 7	**Mock test**	Timed, no-AI assessment + F2F rehearsal

Build one realistic financial database

SAMPLE ENTITY RELATIONSHIPS

Also create BRANCHES, EMPLOYEES, CREDIT POLICIES and DISBURSEMENTS.

Data requirements

Primary / foreign keys; valid relationships; NULLs; duplicates; multiple loan statuses; realistic edge cases.

Business vocabulary

Approval, rejection, disbursement, EMI, overdue amount, repayment and outstanding principal.

SQL: progress from complex to very complex

Level 1 · Foundation

Filter applications by status/date; join customers and loans; count applications by branch; calculate disbursed totals.

Level 2 · Advanced

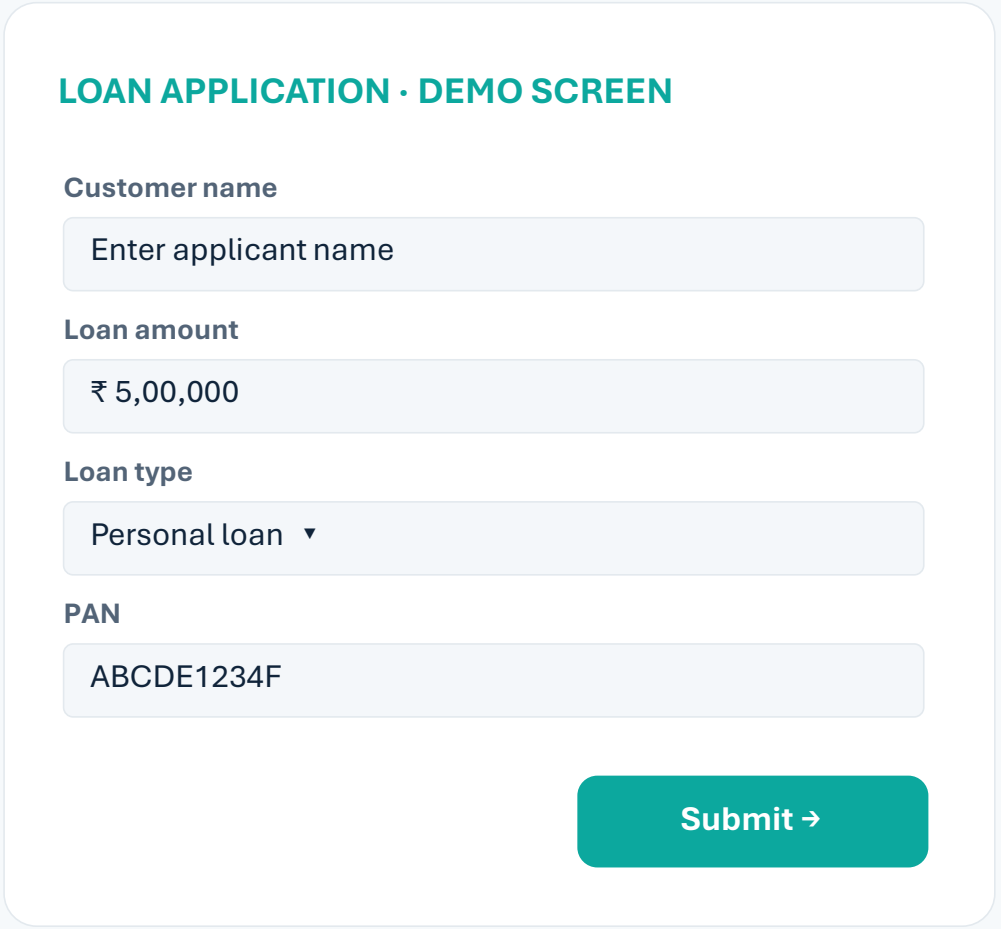

CTEs; subqueries; conditional aggregation; latest application per customer; overdue EMI calculations.

Level 3 · Deep reasoning

Window functions; running balances; duplicates; transaction integrity; query optimization and indexes.

Explain every clause → hide the solution → rewrite → change the requirement → execute.

UI/UX: start with a working page, then change it

HTML

Required fields · dropdown · table · modal

CSS

Grid · spacing · responsive layout

JavaScript

Validation · live calculation · conditional fields

UX quality

Errors · accessibility · loading states

Two prompts candidates can reuse every day

SQL tutor prompt

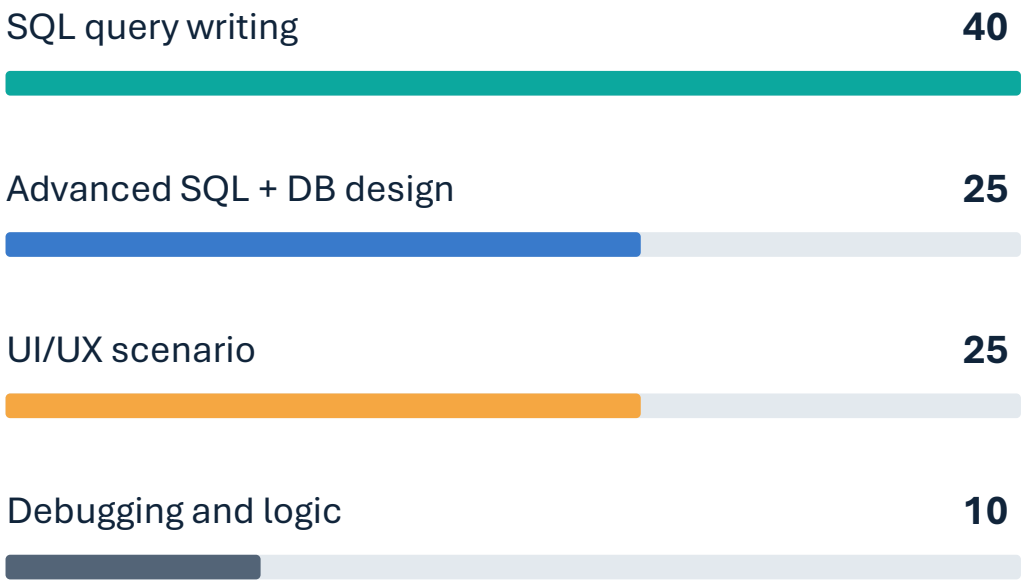

“Using my PostgreSQL loan database, give me five increasingly difficult business questions. First ask me to attempt each SQL query. Then review correctness, edge cases and performance. Explain every clause only after my attempt. Do not fabricate query results.”

UI/UX tutor prompt

“Create a working loan application page in HTML, CSS and vanilla JavaScript. Suggest ten changes involving structure, styling and behavior. Ask me to implement them first, review my code, and explain each change’s visual and functional impact.”

How AIWIZE will assess you

OFFLINE TEST · 120 MINUTES

FACE-TO-FACE · 30 MINUTES

10 min	New SQL query + explanation
5 min	Modify a changed requirement
10 min	UI/UX scenario + component choices
5 min	Debugging + reasoning

Your 7-day commitment

- ✓ Create and populate one runnable financial database.
- ✓ Save all SQL scripts, queries and verified outputs.
- ✓ Build one functional loan form and one dashboard.
- ✓ Implement at least 20 guided UI changes and 5 solo changes.
- ✓ Practice explaining code, errors and trade-offs aloud.
- ✓ Finish Day 7 with a timed, no-AI mock test.

The test is not what ChatGPT can build. The test is what YOU can build.
